

Leftover Food Redistribution

Documentation

1. Introduction

The Leftover Food Redistribution System is a web-based application developed using PHP and MySQL. The system is designed to reduce food waste by connecting donors, receivers, and delivery personnel through a secure and organized platform.

2. Project Objectives

- Reduce food waste through redistribution.
- Provide secure user authentication.
- Manage food delivery operations efficiently.
- Maintain secure session management.
- Enable database-based delivery tracking.

3. Technologies Used

Technology	Purpose
PHP	Backend web development
MySQL	Database management
SQL	Database queries and table creation
HTML/CSS	Frontend structure and design
Sessions	Authentication and security

4. Project File Overview

File Name	Description
Deliveries_Table.sql	Creates the delivery-related database table.
Deliveries_related.sql	Contains SQL queries for delivery operations.
README.md	Provides project overview and setup guide.
login.php	Handles user login and authentication.
logout.php	Handles user logout and session destruction.

register.php	Handles user registration and data insertion.
session_check.php	Checks user session before page access.

5. Deliveries_Table.sql

This SQL file creates the database table for delivery information. It includes fields such as delivery ID, request ID, delivery personnel information, pickup time, delivery time, and delivery status.

6. Deliveries_related.sql

This file contains SQL queries related to delivery management. The queries include INSERT, SELECT, UPDATE, and DELETE operations for maintaining delivery records.

7. README.md

The README file explains the project overview, installation process, technologies used, and instructions for running the application.

8. login.php

This PHP file is responsible for user authentication. It verifies login credentials and creates sessions for authorized users.

9. logout.php

This module destroys active sessions and logs users out securely. It prevents unauthorized access after logout.

10. register.php

This file handles new user registration. User information is validated and securely stored in the database.

11. session_check.php

This file checks whether the user session is active. It ensures that only authenticated users can access protected pages.

12. Conclusion

The Leftover Food Redistribution System provides a practical solution for reducing food waste through secure food redistribution management. The project demonstrates database operations, authentication systems, session management, and delivery handling using PHP and MySQL.
